# Top to Bottom Protection

Don't let the name fool you! PF PalletTops® can protect products from the top or bottom.

PF PalletTops can be used on the top of a load to hold VBoard® in place during stretch-wrapping. It's a great combination that helps stabilize and unitize the load during shipping and handling. The strong framework created by the PF PalletTop and VBoard also provides stackability for pallets of lightweight products.

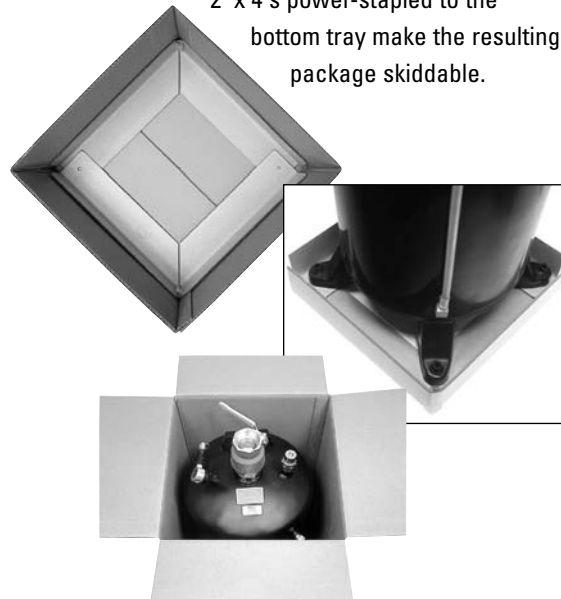

Two PF PalletTops can even be used together to create trays and lids for heavy, thin, rectangular products like the industrial floor scale above. A sheet of particleboard is placed in an upside-down PF PalletTop to create the bottom tray into which the product is loaded. Another sheet of particle-board and second PF PalletTop go on the top, and the entire load is strapped at the edges. 2" x 4"s power-stapled to the bottom tray make the resulting package skiddable.

The strong corners of PF PalletTops help them stand up to strapping pressures like the tie-downs on this flatbed truck to prevent product crush.

A PF PalletTop used in the bottom of a box prevents sharp objects, like the feet of this drain caddy, from poking through the corrugated.
