

The Sustainable Pallet Packaging Alternative

Use VBoard® Pallet Pack to unitize, stabilize and protect pallet loads and irregular-shaped products

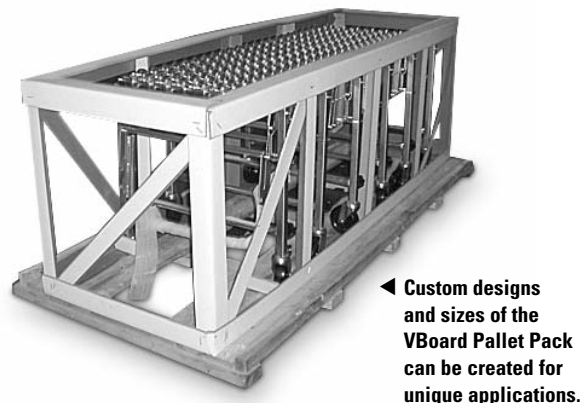

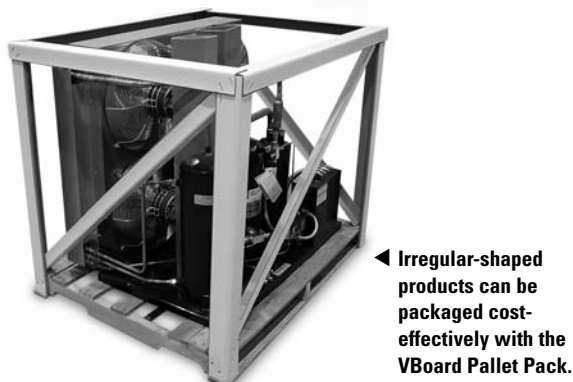

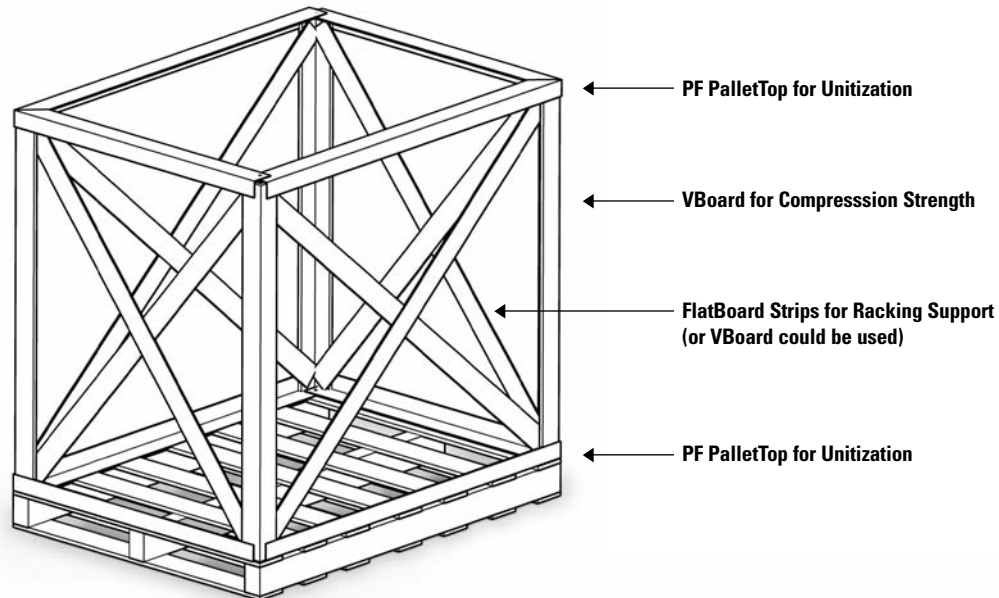

Discover an environmentally friendly, cost-effective method of pallet packaging: the VBoard Pallet Pack. By using a minimal amount of packaging material, it reduces environmental impact while providing the precise protection your product needs for safe transport through your distribution channel.

The VBoard Pallet Pack uses a laminated paperboard PF PalletTop® on the top and bottom for unitization, VBoard edge protectors on the edges for compression strength, and FlatBoard® strips across the sides for racking support. All components are stapled together for secure transport. Designed to double stack in shipping and storing, it provides vertical stacking strength, crush resistance and cushioning.

It is an ideal alternative to wood crates because it is lighter weight, eliminates the risk of bug infestation, and is safer because it does not contain splinters.

It also offers a more sustainable option than a corrugated box, and allows the product to be viewed during transport, which can minimize shipment errors and product damage. At the same time, this "see-through" method allows for easy set-up and merchandising if desired.

All VBoard products are made from recycled materials, approximately 80% of which is post-consumer waste, and are 100% recyclable.
